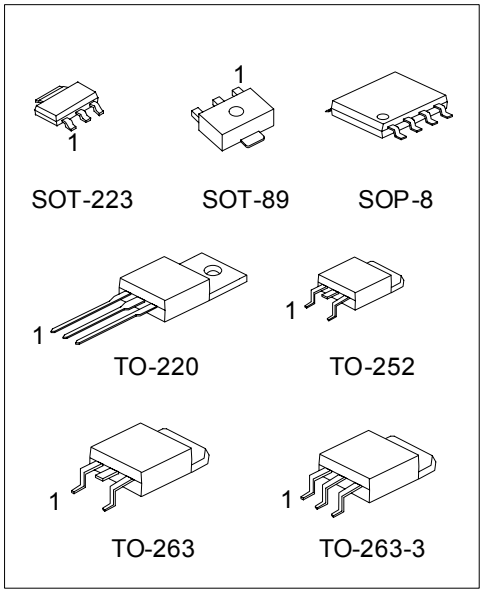
LD1117/A

LINEAR INTEGRATED CIRCUIT

LOW DROP FIXED AND ADJUSTABLE POSITIVE VOLTAGE REGULATORS



*Pb-free plating product number:
LD1117L-xx / LD1117AL-xx

■ DESCRIPTION

The UTC LD1117/A is a low dropout, 3-terminals positive voltage regulator designed to provide output current up to 800mA/1A, even available in adjustable version (V_{REF}=1.25V)and various fixed versions. Diverse surface mount packages optimize the thermal characteristics even offering a relevant space saving effect.

High efficiency is assured by NPN pass transistor. In fact, in the case, unlike than PNP one, the Quiescent Current flows mostly into the load. Only a very common 10μF minimum capacitor is needed for stability. It allows very tight output voltage tolerance within ±1% at 25°C by chip trim. Moreover, the ADJUSTABLE version is pin to pin compatible with the other standard Adjustable voltage regulators maintaining the better performances in terms of Drop and Tolerance.

■ FEATURES

*Low dropout voltage (1V Typ.)
*2.85V device performances are suitable for SCSI-2 active termination
*Output current up to 0.8A/1.0A
*Adjustable version availability (V_{REF}=1.25V)
*Internal current and thermal limit.
*Available in ±1%(at 25°C) and 2% in all temperature range
*Supply voltage rejection: 75dB (Typ.)

■ ORDERING INFORMATION

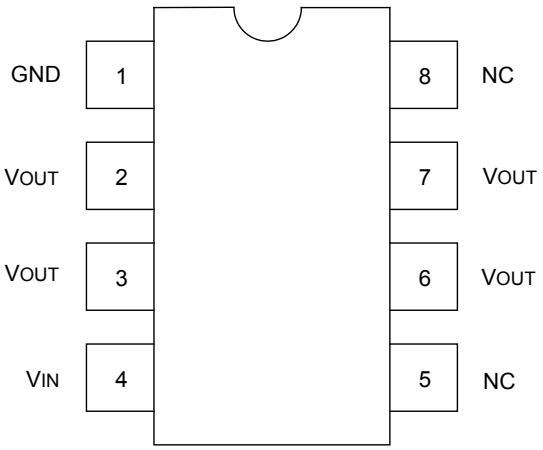
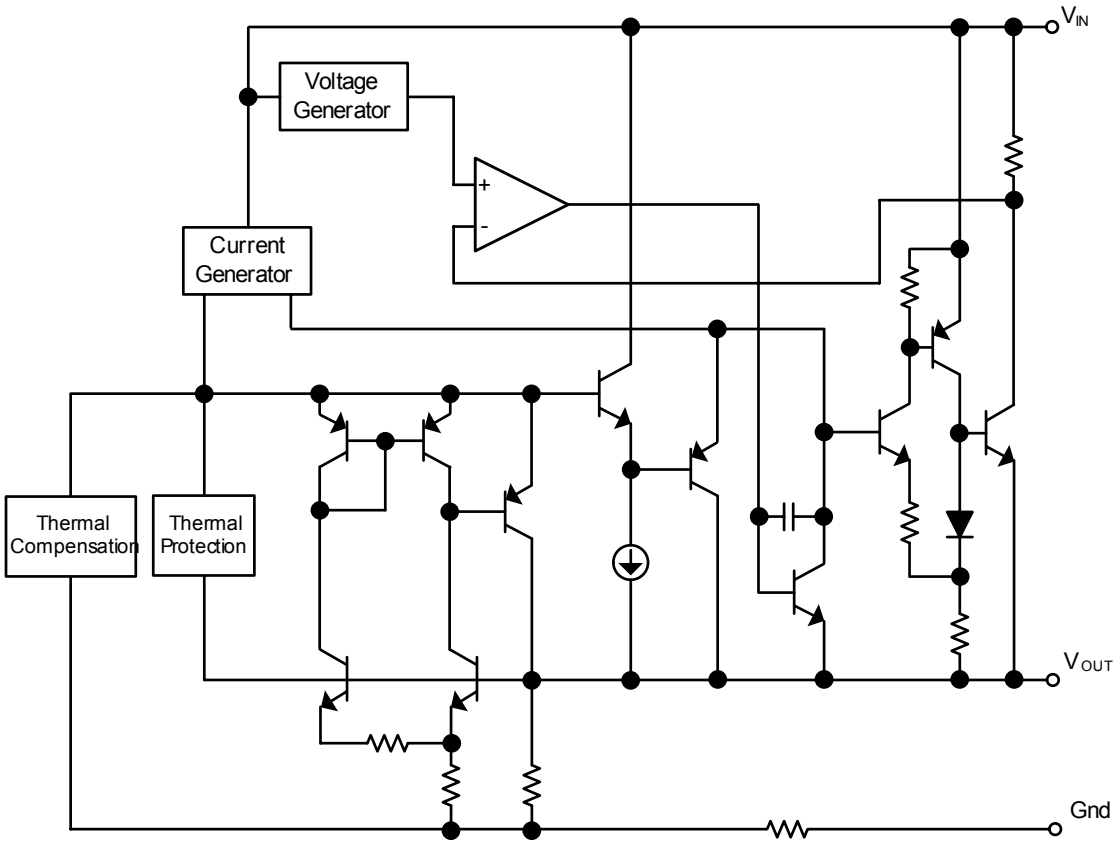
■ PIN CONFIGURATION



■ BLOCK DIAGRAM



■ ABSOLUTE MAXIMUM RATINGS (Ta=25℃)

PARAMETER	SYMBOL	RATINGS	UNIT
DC Input Voltage	V_{IN}	15	V
Power Dissipation	P_D	Internally limited	
Operating Junction Temperature	T_J	0 ~ +125	°C
Storage temperature	T_{STG}	-65 ~ +150	°C

Note Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

■ ELECTRICAL CHARACTERISTICS

(Ta=25℃,refer to the test circuits, T_J=0 to 125°C, Co=10μF unless otherwise specified)

For LD1117/A-1.2

PARAMETER	SYMBOL	TEST CONDITIONS		MIN.	TYP.	MAX.	UNIT

■ APPLICATION NOTE of LD1117/A ADJUSTABLE

The LD1117/A ADJUSTABLE has a thermal stabilized 1.25±0.012V reference voltage between the OUT and ADJ pins. I_{ADJ} is 60μA typ. (120μA max.) and ΔI_{ADJ} is 1μA typ. (5μA max.).
R1 is normally fixed to 120Ω. From figure 7 we obtain:
$V_{OUT}=V_{REF}+R2(I_{ADJ}+I_{R1})=V_{REF}+R2(I_{ADJ}+V_{REF}/R1)=V_{REF}(1+R2/R1)+R2\times I_{ADJ}$.
In normal application R2 value is in the range of few KΩ,, so the R2 X I_{ADJ} product could not be considered in the V_{OUT} calculation; then the above expression becomes: $V_{OUT}=V_{REF}(1+R2/R1)$
In order to have the better load regulation it is important to realize a good Kelvin connection of R1 and R2 resistors. In particular R1 connection must be realized very close to OUT and ADJ pin, while R2 ground connection must be placed as near as possible to the negative Load pin. Ripple rejection can be improved by introducing a 10μF electrolytic capacitor placed in parallel to the R2 resistor (See Fig. 8)
